The term "optionally substituted" means optional substitution with the specified groups, radicals or moieties, in available position or positions.

With reference to the number of moieties (e.g., substituents, groups or rings) in a compound, unless otherwise defined, the phrases "one or more" and "at least one" mean that there can be as many moieties as chemically permitted, and the

- 20 -

determination of the maximum number of such moieties is well within the knowledge of those skilled in the art.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

The wavy line ~~~~ as a bond generally indicates a mixture of, or either of, the possible isomers, e.g., containing (R)- and (S)- stereochemistry. For example,

Prodrugs and solvates of the compounds of the invention are also contemplated herein. The term "prodrug", as employed herein, denotes a compound that is a drug precursor that, upon administration to a subject, undergoes chemical conversion by metabolic or chemical processes to yield a compound of formula I or a salt and/or solvate thereof. A discussion of prodrugs is provided in T. Higuchi and V. Stella, *Pro-drugs as Novel Delivery Systems* (1987) Volume 14 of the A.C.S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, (1987) Edward B. Roche, ed., American Pharmaceutical Association and Pergamon Press, both of which are incorporated herein by reference thereto.

"Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanlates, methanlates, and the like. "Hydrate" is a solvate wherein the solvent molecule is H₂O.

"Effective amount" or "therapeutically effective amount" is meant to describe an amount of compound or a composition of the present invention effective in inhibiting gamma-secretase and thus producing the desired therapeutic effect in a suitable patient.

The compounds of formula I form salts that are also within the scope of this invention. Reference to a compound of formula I herein is understood to include reference to salts thereof, unless otherwise indicated. The term "salt(s)", as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a compound of formula I contains both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. Pharmaceutically acceptable (*i.e.*, non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful. Salts of the compounds of the formula I may be formed, for example, by reacting a compound of formula I with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates, adipates, alginates, ascorbates, aspartates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, cyclopentanepropionates, digluconates, dodecylsulfates, ethanesulfonates, fumarates, glucoheptanoates, glycerophosphates, hemisulfates, heptanoates, hexanoates, hydrochlorides, hydrobromides, hydroiodides, 2-hydroxyethanesulfonates, lactates, maleates, methanesulfonates, 2-naphthalenesulfonates, nicotines, nitrates, oxalates, pectinates, persulfates, 3-phenylpropionates, phosphates, picrates, pivalates, propionates, salicylates, succinates, sulfates, sulfonates (such as those mentioned herein), tartarates, thiocyanates, toluenesulfonates (also known as tosylates), undecanoates, and the like. Additionally, acids which are generally considered suitable for the formation of pharmaceutically useful salts from basic pharmaceutical compounds are discussed, for example, by S. Berge *et al*, *Journal of Pharmaceutical Sciences* (1977) 66(1) 1-19; P. Gould, *International J. of Pharmaceutics* (1986) 33 201-217; Anderson *et al*, *The Practice of Medicinal Chemistry* (1996), Academic Press, New York; and in *The Orange Book* (Food & Drug Administration, Washington, D.C. on their website). These disclosures are incorporated herein by reference thereto.

Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as

- 22 -

All such acid salts and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Compounds of the invention with a carboxylic acid group can form pharmaceutically acceptable esters with an alcohol. Examples of suitable alcohols include methanol and ethanol.

Compounds of formula I, and salts, solvates and prodrugs thereof, may exist in their tautomeric form (for example, as an amide or imino ether). All such tautomeric forms are contemplated herein as part of the present invention.

All stereoisomers (for example, geometric isomers, optical isomers and the like) of the present compounds (including those of the salts, solvates and prodrugs of the compounds as well as the salts and solvates of the prodrugs), such as those which may exist due to asymmetric carbons on various substituents, including enantiomeric forms (which may exist even in the absence of asymmetric carbons), rotameric forms, atropisomers, and diastereomeric forms, are contemplated within the scope of this invention. Individual stereoisomers of the compounds of the invention may, for example, be substantially free of other isomers, or may be admixed, for example, as racemates or with all other, or other selected, stereoisomers. The chiral centers of the present invention can have the S or R configuration as defined by the *IUPAC 1974 Recommendations*. The use of the terms "salt", "solvate" "prodrug" and the like, is intended to equally apply to the salt, solvate and prodrug of enantiomers, stereoisomers, rotamers, tautomers, racemates or prodrugs of the inventive compounds.

Compounds of formula I can be prepared by various methods well known to those skilled in the art, and by the methods described below.

- 37 -

Method 1

In Method 1, compounds of formula I having the structure Ia are prepared.

In method 1, R^{12} represents the Y substituents defined above in paragraphs (3) to (18) of the definition of Y. When the reagents $R^{12}COCl$ or $R^{12}COOH$ are used in Method 1, then Y in formula Ia represents R^{12} .

In Method 1, a trans-substituted N-Boc-cyclic amine 2-carboxaldehyde 1 is epimerized to the corresponding cis isomer using a mild base such as potassium carbonate (path a). The cis geometry is retained in all subsequent steps. Alternatively, the epimerization step can be omitted to yield trans products (path b). Aldehyde 2 is reduced using a reducing agent such as sodium borohydride. The alcohol is protected using a typical protecting group such as a t-butyldiphenylsilyl ether, and the Boc group is removed under acidic conditions to give 3. The cyclic amine is converted to a sulfonamide by reaction with a sulfonyl halide, and the alcohol protecting group is removed under standard conditions to give 4. Alcohol 4 can be converted to a variety of compounds of type Ia using methods well known to those skilled in the art. For example, carbamates can be prepared by reaction of 4 with 4-nitrophenylchloroformate followed by reaction of the resulting carbonate with a

- 38 -

primary or secondary amine. Alternatively, esters can be prepared by reaction of 4 with either an acid halide of a carboxylic acid in the presence of a suitable coupling reagent such as EDCI and HOBT.

Starting material of formula 1 in Method 1 are known in the art or can be prepared as described below.

Method 2

In Method 2, compounds of formula I having the structure Ib are prepared.

In Method 2, R^{12} is as defined in Method 1

In Method 2, alcohol 4 from method 1 converted to the corresponding primary or secondary amine under a variety of conditions, such as by reaction with phthalimide under Mitsunobu conditions followed by treatment with hydrazine or by reaction with a primary amine under Mitsunobu conditions. The resulting amine is converted to ureas or to amides Ib using the same procedures described for carbamates and esters in Method 1.

Methods 3-A and 3-B

In Methods 3-A and 3-B, compounds of formula I having the structure Ic are prepared.

- 39 -

Method 3-A

In Method 3-A, 2,6-dibromopyridine is reacted with a boronic acid derivative $R^{11}B(OH)_2$ (most preferably an aryl or vinyl boronic acid) in the presence of a palladium catalyst. The resulting 6-substituted 2-bromopyridine is formylated by treatment with an alkyl lithium such as *n*-butyllithium followed by treatment with a formylating agent such as dimethylformamide to give 7-A. This product is hydrogenated to give alcohol 8 (where any unsaturation in R^{11} may also have been reduced). Alcohol 8 can be converted to compounds of formula 1c using the procedures previously described.

Method 3-B

In Method 3-B, 6-bromopyridine-3-carboxylic acid 6-B is converted to its methyl ester under standard conditions followed by reaction with a boronic acid derivative $R^{11}B(OH)_2$ (most preferably an aryl or vinyl boronic acid) in the presence of a palladium catalyst to give 7-B. This is then hydrogenated using a suitable catalyst such as platinum oxide, preferably in the presence of acetic acid, then reduced with a hydride reagent such as lithium aluminum hydride to give alcohol 8. Alcohol 8 can be converted to compounds of formula 1c using the procedures previously described.

Method 4

The resulting organometallic derivative is reacted with an aldehyde R^{20}CHO , and the product is deoxygenated under a variety of conditions, such as by treatment with triethylsilane, to give **9**. Compound **9** is formylated and the resulting formyl derivative converted compounds of type **Id** using the procedures previously described.

Intermediate **4a** can be converted to compounds of type **li** using the procedures described in Methods 1 through 8. Alternatively, **4** can be converted to ester **19** and then treated with a Grignard reagent to give **4b**. This is converted to compounds of type **lj** as previously described.

Method 10:

- 45 -

Ester **20** is protected with a suitable protecting group (Prot) such as t-butyltrimethylsilyl ether, and the pyridine is reduced by well-known methods such as by treatment with hydrogen gas in the presence of a catalyst such as platinum oxide in a solvent such as ethanol or ether, to give piperidine **21**. This acid can be transformed to a variety of heteroaryl moieties using methods well known to those skilled in the art. For instance, coupling with 2-aminoethanol followed by oxidation and dehydrative cyclization according to the method of Morwick *et al* (*Organic Letters* 2002, 2665) gives **28** where $R^{11} = 2\text{-oxazolyl}$. Method 16

An aldehyde $R^{11}CHO$ is treated with a sulfonamide in the presence of a suitable dehydrating agent such as molecular sieves to give an N-sulfonylimine **A**. A protected hydroxaldehyde **44**, where the protecting group is for example a silyl ether, is converted to an unsaturated ketone **45** by treatment with an appropriate olefinating reagent, such as 1-triphenyl phosphoranylidene-2-propanone. This is converted to a diene by treatment with base followed by treatment with an alkylating or silylating agent such as t-butyldimethylsilylchloride to give **46**. The diene undergoes Diels-Alder reaction with N-sulfonylimine **A** at a suitable temperature, typically room temperature to 150°C, to give a tetrahydropyridine derivative which is hydrolyzed with an acid

- 51 -

such as aqueous HCl to give the piperidinone derivative **47**. The carbonyl group of **47** can be removed by a variety of methods. For instance, the carbonyl group can be reduced to alcohol **48** using hydride reagents such as sodium borohydride, optionally in the presence of cerium trichloride. The resulting alcohol can be deoxygenated by conversion to xanthate **49** followed by treatment with tri-nbutyltin hydride to give **50**. The protecting group of **50** is removed, for instance by treatment with an acid or with fluoride to remove the silyl protecting group, and the resulting alcohol **51** can be converted to compounds of type **1p** using the methods previously described. Alternatively, alcohol **48** can be converted to compounds of type **1q** (where G = OH or O-alkyl) using similar methods. Chiral compounds of this invention can be resolved by chromatography over a chiral stationary phase as described in the examples.

Example 1

Step 1

Racemic trans 1-(tert-butoxycarbonyl)-2-formyl-6-methyl-piperidine was obtained as described in S. Chackalamannil, R. J. Davies, Y. Wang, T. Asberom, D. Doller, J. Wong, D. Leone and A. T. McPhail, *J. Org. Chem.* **1999**, 64, 1932-1940, which is incorporated herein by reference in its entirety. A solution of 5.44 g of this

- 53 -

aldehyde was stirred in 100 mL of methanol with 6.0 g of K_2CO_3 overnight. Solids were filtered out, and the residue was concentrated. The mixture was redissolved in DCM, washed with water, dried over Na_2SO_4 , concentrated and purified chromatographically using 7% ethyl acetate in hexanes as solvent to furnish 3.2 g of product.

Step 2

a) To a solution of 3.21 g (14.1 mmol) of the product of Step 1 in 20.0 mL of THF at 0°C was added 534 mg (14.1 mmol) of sodium borohydride. The mixture was stirred for 1.5 h, quenched with saturated $NaHCO_3$, extracted with ether, dried over Na_2SO_4 and freed from solvent under vacuum to give 3.08 g of crude alcohol.

b) The crude alcohol from step 2 was dissolved in 20.0 mL of DMF and treated with 1.83 g (27 mmol) of imidazole and 4.79 g (17.5 mmol) of TBDPSCI. The mixture was stirred overnight, diluted with DCM, washed with water, dried over Na_2SO_4 , and solvent was evaporated. The product was purified by chromatography to furnish 4.67 g of TBDPS ether.

c) A solution of 4.67 g of TBDPS ether in 15 mL of DCM was cooled to 0°C and treated with a mixture containing 30 mL of 99% TFA and 70 mL of DCM. Cooling was removed and the mixture was stirred for 1.5 h. Volatiles were evaporated, the residue was re-evaporated with DCM, re-dissolved in DCM, washed with saturated $NaHCO_3$, dried over Na_2SO_4 , concentrated and passed through a silica gel plug using 5% MeOH in DCM as solvent to yield 3.50 g of product.

Step 3

a) A mixture of 3.50 g (9.53 mmol) of the product of Step 2, 3.02 g (13.84 mmol) of 4-chlorobenzenesulfonyl chloride and 1.92 g (19.06 mmol) of triethylamine in 20.0 mL of DCM was stirred over a period of 48 h. The reaction mixture was washed with saturated $NaHCO_3$, dried over Na_2SO_4 , concentrated and purified by chromatography using 10% ethyl acetate in hexanes as the eluent to yield 4.66 g of sulfonamide.

b) The resulting sulfonamide (4.66 g, 8.61 mmol) was dissolved in 50.0 mL of THF and treated with 17.2 mL (17.2 mmol) of 1M TBAF/THF solution. The mixture was stirred over 1.5 h, poured into water, extracted with ethyl acetate and DCM. The combined organic phases were dried over Na_2SO_4 , concentrated and purified by

- 54 -

chromatography using gradient of 10-30% ethyl acetate in hexanes as solvent to furnish 2.39 g of product.

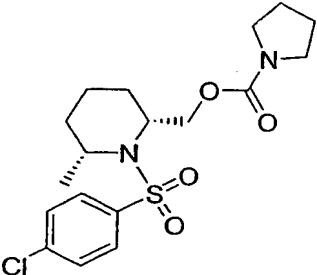

Step 4

5 a) To a mixture of 712 mg (2.3 mmol) of the product of step 3, and 370 mg (4.6 mmol) of pyridine in 10 mL of DCM at 0 °C was added a solution of 927 mg (4.6 mmol) of 4-nitrophenylchlorocarbonate in 5 mL of DCM. The mixture was stirred overnight at ambient temperature, treated with an additional 0.17 mL of pyridine and 100 mg of 4-nitrophenylchlorocarbonate and stirred for additional 5 h. The mixture was diluted with DCM, washed with water, dried over Na₂SO₄, purified by
10 chromatography using 20% ethyl acetate in hexanes as solvent to furnish 860 mg of 4-nitrophenylcarbonate.

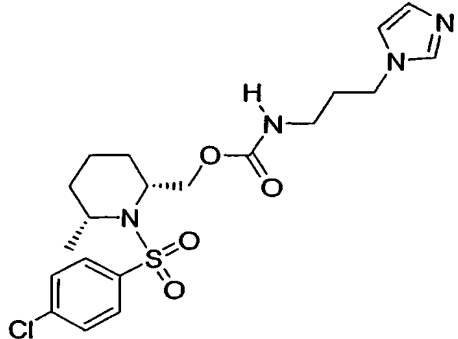

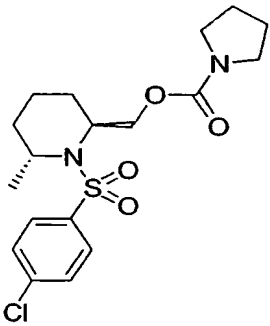

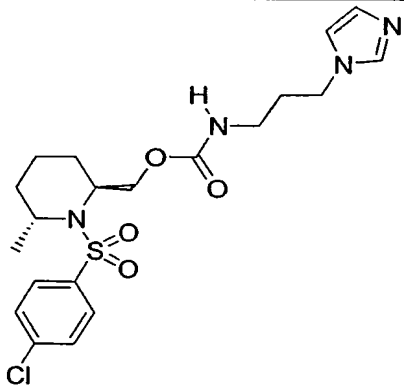

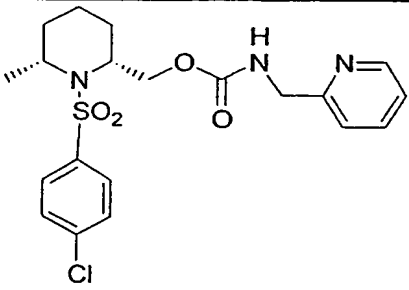

b) To a solution of 20 mg of the above product in 0.5 mL of DMF was added 20 mg of 4-(1-piperidino)piperidine. The mixture was allowed to stand overnight, diluted with DCM, washed with 1M NaOH, dried over Na₂SO₄ and purified by prep. TLC (5%
15 MeOH/DCM) to furnish 17 mg of the desired product. ¹H NMR (CDCl₃, 300 MHz) δ 7.75 (2H, d, J=8.5 Hz), 7.45 (2H, d, J=8.5 Hz), 4.33-4.20 (4H, m), 4.11-4.00 (2H, m), 2.74 (2H, wide), 2.48-2.34 (5H, ser.m.), 1.80-1.22 (16H, ser.m.), 1.30 (3H, d, J=7.1 Hz); MS (ES) *m/e* 498.1 (M+H)⁺.

20 Following procedures similar to those in Example 1, the compounds in Table 1 were prepared.

5

Preparation A: cis (6-Phenyl-piperidin-2-yl)-methanol:**Step 1**

(a) To a mixture of 600 mg (2.5 mmol) of 2,6-dibromopyridine in 15 mL of toluene was added a mixture of 150 mg (1.27 mmol) of phenylboronic acid in 5 mL of methanol, 86 mg (0.075 mmol) of $\text{Pd}(\text{PPh}_3)_4$ and 15 mL of 2 M Na_2CO_3 . The mixture was refluxed overnight, cooled, extracted with ethyl acetate, dried and 2-bromo-6-phenylpyridine isolated chromatographically from unreacted 2,6-dibromopyridine and 2,6-diphenylpyridine.

(b) To a solution of 7.2 g (31.03 mmol) of 2-bromo-6-phenylpyridine in 50 mL of THF at -78°C was added drop-wise 13.5 mL (31 mmol) of 2.3 M n-BuLi in hexanes followed by 10 mL of DMF. The mixture was stirred in the cold for 30 min, quenched with saturated NaHCO_3 , extracted with ethyl acetate, dried, concentrated, and purified by chromatography using a gradient of 3-5% of ethyl acetate in hexanes to provide 2.02 g of product

Step 2

To a solution of 2 g of the product of step 1 in 20 mL of MeOH was added 5 mL of AcOH and 300 mg of PtO_2 . The mixture was hydrogenated under a balloon. The progress of the reaction was followed by taking NMR spectra of worked-up portions. After overnight stirring another portion of 300 mg of PtO_2 was added and hydrogenation continued for additional 24 h. Catalyst was filtered out, volatiles evaporated, residue re-dissolved in DCM and washed with 1M NaOH solution, saturated NaHCO_3 , dried, and evaporated. Column chromatography yielded 1.30 g of

- 67 -

cis (6-phenyl-piperidin-2-yl)-methanol and 200 mg of cis (6-cyclohexyl-piperidin-2-yl)-methanol.

Preparation B: Alternate synthesis of cis (6-phenyl-piperidin-2-yl)-methanol:

Step 1

5 6-bromopicolinic acid (1.99 g) in DMF (10 mL) was treated with potassium carbonate (1.40 g) and then methyl iodide (4 mL) at room temperature for 20 h. The reaction mixture was diluted with dichloromethane (60 mL) and filtered. The filtrate was extracted with brine (twice), dried (MgSO_4), and concentrated under vacuum to give methyl 6-bromopicolinate as a pale yellow solid (1.75 g).

10 **Step 2**

 Methyl 6-bromopicolinate (0.75 g), phenylboronic acid (0.61 g), tetrakis(triphenylphosphine)palladium (0.19 g) and potassium carbonate (0.75 g) in toluene (20 mL) and methanol (4.5 mL) were heated at reflux for 1 hr. The reaction mixture was then cooled, diluted with dichloromethane, and filtered. The filtrate was
15 washed with water, and the dried (K_2CO_3) organic solution was concentrated under vacuum to give an amber residue (0.81 g). The residue was purified by chromatography on silica gel plates (8, 1000 μm) using hexane:ethyl acetate 3:1 as the eluent, to give methyl 6-phenylpicolinate as a colorless oil (0.55 g).

Step 3

20 Under a hydrogen atmosphere, a solution of methyl 6-phenylpicolinate (0.55 g) in MeOH (30 mL) and glacial acetic acid (15 mL) was stirred in the presence of platinum oxide (0.150 g) for 5 hr. The reaction mixture was purged with nitrogen. The reaction mixture was filtered and concentrated under vacuum to give a yellow oil (0.77 g). The oil was purified by chromatography on silica gel plates (8, 1000 μm)
25 using hexane:ethyl acetate 3:1 as the eluent, to give methyl 6-phenylpipercolinate as a colorless oil (0.23 g).

Step 4

 A solution of methyl 6-phenylpipercolinate (0.23 g) in THF (15 mL) was treated with 1M lithium aluminum hydride in ether (10 mL) at room temperature for 2 h. The
30 reaction mixture was quenched with EtOAc, then MgSO_4 was added and the mixture was filtered. The filtrate was concentrated to give a residue, which was purified by chromatography on silica gel plates (2, 1000 μm) using EtOAc:hexane 1:1 as the eluent, to give (6-phenyl-piperidin-2-yl)-methanol as a white solid (0.06 g).

- 68 -

Preparation C:**Step 1**

(a) At 0°C, to a solution of 1.29 g (6.77 mmol) of cis (6-phenyl-piperidin-2-yl)-methanol (prepared by the method of Preparation A or Preparation B) in 20.0 mL of DCM was added 1.90 mL (13.6 mmol) of triethylamine and 1.84 mL (10.1 mmol) of trimethylsilyl trifluoromethanesulfonate. The mixture was stirred for 1 h at ambient temperature, washed with saturated NaHCO₃, dried over Na₂SO₄ and volatiles were evaporated.

(b) The residue was re-dissolved in DCM, treated with 1.90 mL (13.5 mmol) of triethylamine and 2.11 g (10.0 mmol) of 4-chlorobenzenesulfonylchloride. The mixture was stirred for 24 h, washed with 1M HCl, saturated NaHCO₃, and concentrated.

(c) To insure cleavage of TMS ether, the material was dissolved in methanol (5 mL), treated with 1 mL of 1M HCl, stirred for 30 min, and concentrated. The residue was chromatographed using 10-20% ethyl acetate in hexanes to furnish 1.45 g of 1-(4-chloro-benzenesulfonyl)-6-phenyl-piperidin-2-yl]-methanol.

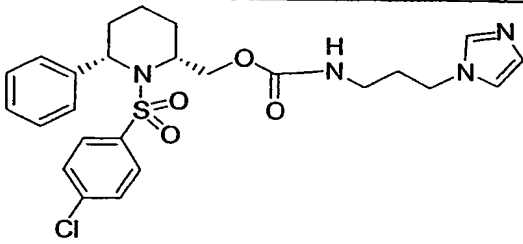

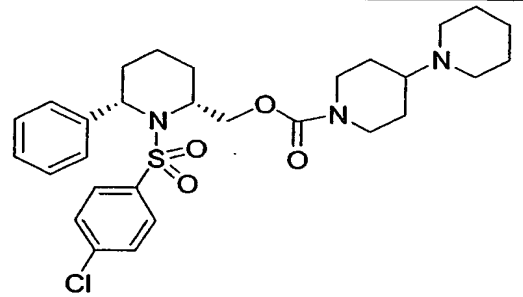

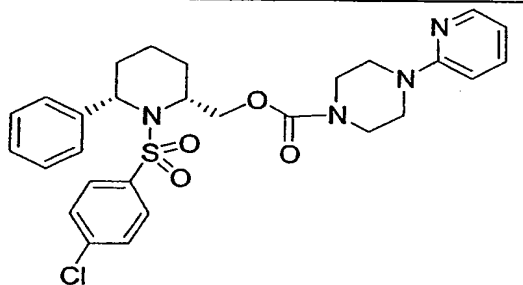

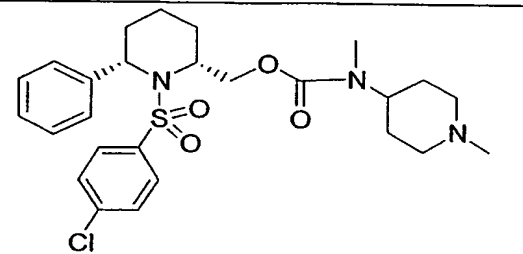

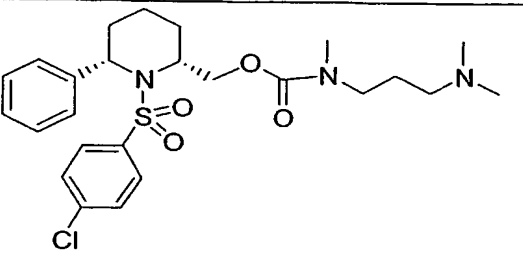

Step 2

The product of Step 1 was converted to the title compound according to Step 4 of Example 1, using N-cyclohexylpiperazine at the last stage as the amine. ¹H NMR (CDCl₃ 300 MHz) δ 7.86 (2H, d, J=8.2 Hz), 7.57-7.49 (4H, m), 7.36-7.24 (3H, m), 5.24 (1H, d, J=4.9 Hz), 4.34 (1H, q, J=6.2 Hz), 3.68 (1H, dd, J=11.0, 6.5 Hz), 3.58-3.40 (5H, ser.m.), 2.55 (4H, m), 2.37-2.24 (2H, ser.m.), 1.90-1.58 (6H, ser.m.), 1.53-1.36 (3H, ser.m.), 1.30-1.13 (6H, ser.m.); MS (ES) m/e 560.1 (M+H)⁺.

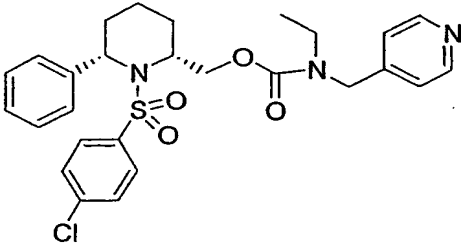

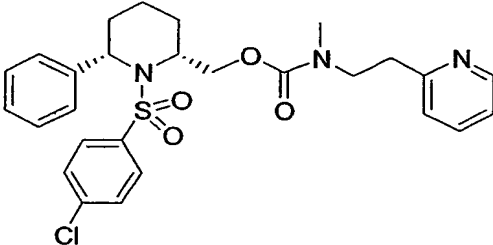

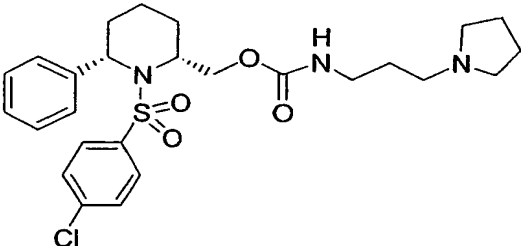

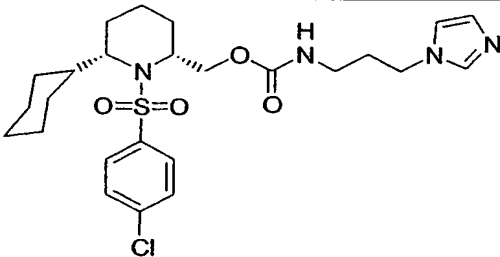

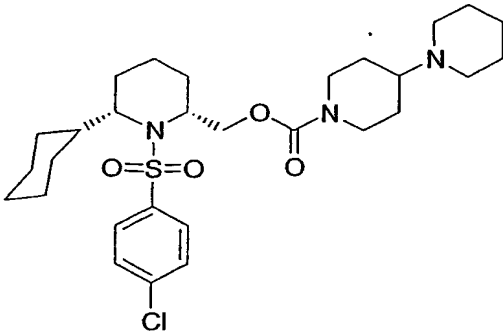

Following procedures similar to those in Example 53, the compounds in Table 4 were prepared. Cis-(6-cyclohexyl-piperidin-2-yl)-methanol, obtained in Preparation A, step 2, was used in Examples 63-66.

Step 1

(a) A solution of 1.00 g (4.29 mmol) of 2,6-dibromopyridine in a mixture of 20 mL of ether and 20 mL of THF was cooled to -78°C (the solution became turbid due to partial precipitation). To this was added drop-wise 1.86 mL (4.29 mmol) of 2.3 M BuLi, and the reaction mixture was stirred for 5 min.

(b) Benzaldehyde (456 mg, 4.3 mmol) was added drop-wise to the above mixture, and the reaction mixture was stirred in the cold for 15 min, quenched with saturated NaHCO_3 , extracted with ethyl acetate, dried, and concentrated. The residue was purified by chromatography using a gradient of 10-30% of ethyl acetate in hexane as the eluent, to give 0.85 g of oily product.

(c) A mixture of the above product, 5 ml of triethylsilane, 5 mL of TFA and 5 mL of DCM was heated at reflux over a period of 36 h. After evaporating most of the volatiles, the residue was redissolved in DCM, washed with 1M NaOH, dried, concentrated, and purified by chromatography using 5% ethyl acetate in hexanes, to yield 0.55 g of the product.

Example 105**Preparation A****Step 1**

A solution of the 4-nitrophenylcarbonate product of Example 1, step 4-a (1.26 g) in methanol (50 mL) was treated with 1,4-dioxo-8-azaspiro[4.5]decane (0.76 mL) and the resulting mixture was stirred at room temperature for 66 h. The reaction

- 103 -

mixture was concentrated under vacuum and the residue was partitioned between ethyl acetate / 10% sodium hydroxide solution. The ethyl acetate (EtOAc) solution was extracted with water and then brine. The dried (MgSO_4) EtOAc solution was concentrated under vacuum to give a pale yellow oil (1.26 g). The oil was purified by chromatography on silica gel plates (8, 1000 μ) using EtOAc:hexane 1:3 as the eluent (two elutions) to give the title compound, as a colorless oil (1.11 g).

Step 2

To the product of step 1 (1.10 g) in dichloromethane (20 mL), 40% trifluoroacetic acid (TFA) in water (8 mL) was added, and the resulting mixture was stirred for 4 hr. An additional portion of 40% TFA in water (6 mL) was then added. After 2 h, a third portion of 40% TFA in water (3 mL) was added. The resulting mixture was stirred at room temperature for 18 hr. The reaction mixture was then separated and the dichloromethane washed with water and then sodium bicarbonate solution. The dried (MgSO_4) dichloromethane solution was concentrated under vacuum to give a colorless foam. The foam was purified by chromatography on silica gel plates (8, 1000 μ) using EtOAc:hexane (1:3) as the eluent to give the title compound (0.80 g).

Preparation B**Step 1**

The 4-nitrophenylcarbonate product of Example 1, step 4-a (0.100 g) in methanol (55 mL) was treated with 3-hydroxypiperidine (0.060 g, liberated from the hydrochloride salt) and the resulting mixture was stirred at room temperature for 24 h. The reaction mixture was concentrated under vacuum and the residue was partitioned between an ethyl acetate / 10% sodium hydroxide solution. The ethyl acetate (EtOAc) solution was extracted with water, and then brine. The dried (MgSO_4) EtOAc solution was concentrated under vacuum to give the title compound, as a colorless oil (0.10 g).

Step 2

- 104 -

The product from step 1 in acetone (5 mL) was treated with Jones Reagent (0.40 mL) for 40 min at room temperature. The reaction mixture was quenched with MeOH (2mL), filtered, and diluted with dichloromethane. The organic mixture was extracted with brine. The dried (MgSO_4) solution was concentrated under vacuum to give a residue (0.070 g). This residue was purified by chromatography on silica gel plates (1, 1000 μ) using EtOAc:hexane 1:3 as the eluent to give the title compound (0.040 g).

Preparation C

Essentially the same procedure as in Preparation B where followed, except that 3-hydroxypyrrolidine (0.060 g) was used to give the title compound (0.030 g).

Preparation D

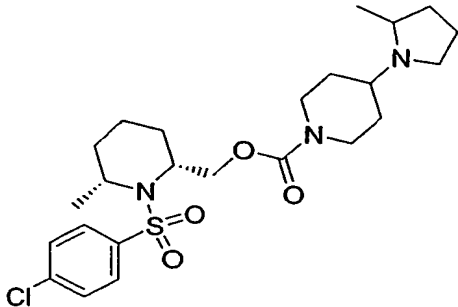

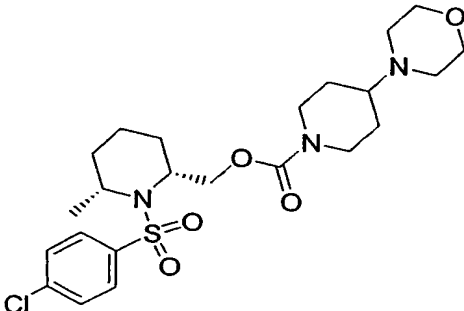

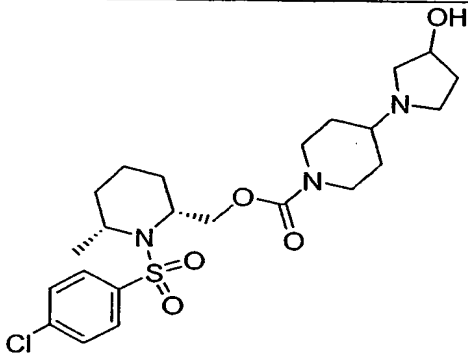

Following the procedure described below, the compounds in Table 11 were prepared from the appropriate ketones and amines. The ketones and amines used would be apparent to those skilled in the art from the structure of the compounds in Table 11.

Using BOHDAN Miniblocks (6 mL cartridge), ketones from Preparation A, B or C (0.010 g) in MeOH:AcOH 9:1 (1 mL) were dispensed. Amines (1.2 equiv) were then added, followed by MP-cyanoborohydride resin (~2 equiv, 20 to 30 mg, 2.37 mmol/g, Argonaut). The resulting mixture was shaken at room temperature for 20 hr. PS-isocyanate resin (50 – 60 mg, 4 equiv. 1.44 mmol/1 g, Argonaut) was then added. After 4h, additional PS-isocyanate resin (90-100 mg) was added, and the mixture was shaken overnight. The mixture was filtered from BOHDAN block to block and the residue was washed with MeOH (1 mL). MP-TsOH resin (~4 equiv., 1.46 mmol/mg, Argonaut) was added to the filtrate followed by dichloroethane (1 mL), and the mixture was shaken for 2-4 hr. The mixture was then drained and washed with MeOH (1 mL, 3 times). 2M NH_3 /MeOH (1.5 mL) was added, and the mixture was shaken for 30 min, then drained into vials. 2M NH_3 /MeOH (2 mL) was added and the mixture

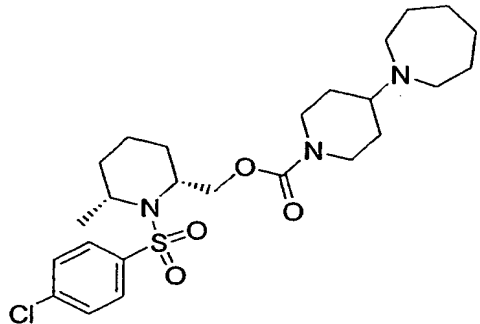

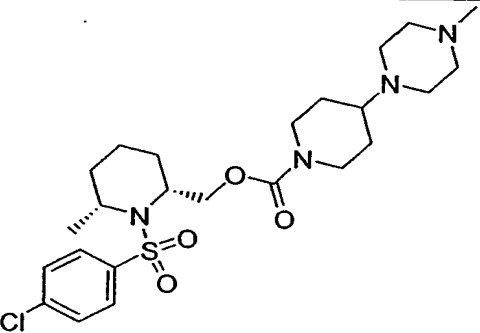

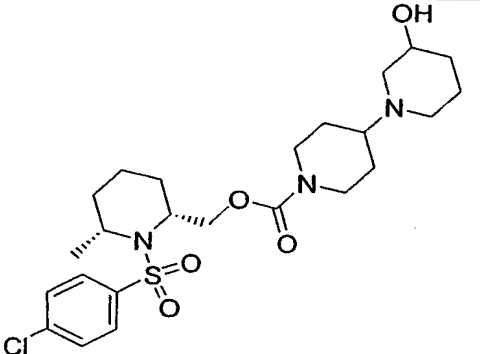

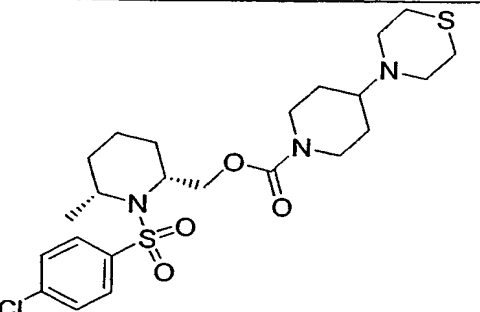

- 105 -

was shaken for 10 min. and drained. The solvent was then removed to give the products in Table 11.

Compound 2: To a solution of 1'-tert-Butoxycarbonyl-[1,4']-Bipiperidine 1 (5.1 g, 19.0 mmol), TMEDA (19 mL) in dry Et₂O (40 mL) at -78°C is slowly added a solution of sec-butyllithium (19.0 mL, 24.7 mmol, 1.3 M in cyclohexanes) over a period of 30 min. The mixture is stirred at -78°C for 3 hr, and then is treated with a solution of dimethylsulfate (3.6g, 28.5 mmol) in Et₂O (5 mL). The cooling bath is removed and the reaction mixture is stirred at ambient temperature for 16 hr. After cooling to 0°C, the reaction mixture is quenched with water, extracted with Et₂O (5X100 mL), and the combined ether layers are dried over K₂CO₃. The solvent is removed under vacuum and the residue is purified by silica gel chromatography (eluting with 40% ethyl acetate in hexane) to give 2.51 g of 1'-tert-butoxycarbonyl-2'-methyl-[1,4']-bipiperidine, 2.

Compound 3: To a stirring solution of compound 2 (1.5 g, 5.3 mmol) in DCM (10 mL) is added TFA, and the mixture is stirred at room temperature for 2 hr. After removing the volatiles, the residue is diluted with DCM, basified with 30% NH₄OH to

After stirring at room temperature for 3 hr, the reaction mixture was diluted with EtOAc (730 mL), washed with 3% HCl, saturated NaHCO₃, and brine, dried (Na₂SO₄), and concentrated under vacuum. The crude product was purified using silica gel chromatography (10-30% EtOAc/hexanes) to give 11.6 g (67%) of N-Boc-D-pyroglutamic acid methyl ester as a yellowish solid. ¹H NMR (CDCl₃, 300 MHz) δ 4.73 (1H, dd), 3.90 (3H, s), 2.80-2.20 (4H, m), 1.62 (9H, s).

5 **Assay:**

Gamma secretase activity was determined as described by Zhang *et al.* (*Biochemistry*, **40** (16), 5049 -5055, 2001). Activity is expressed either as a percent inhibition or as the concentration of compound producing 50% inhibition of enzyme activity.

10 Reagents

Antibodies W02, G2-10, and G2-11 were obtained from Dr. Konrad Beyreuther (University of Heidelberg, Heidelberg, Germany). W02 recognizes residues 5-8 of A β peptide, while G2-10 and G2-11 recognize the specific C-terminal structure of A β 40 and A δ 42, respectively. Biotin-4G8 was purchased from Senetec (St. Louis, MO). All tissue culture reagents used in this work were from Life Technologies, Inc., unless otherwise specified. Pepstatin A was purchased from Roche Molecular Biochemicals; DFK167 was from Enzyme Systems Products (Livermore, CA).

20 cDNA Constructs, Tissue Culture, and Cell Line Construction

The construct SPC99-Lon, which contains the first 18 residues and the C-terminal 99 amino acids of APP carrying the London mutation, has been described (Zhang, L., Song, L., and Parker, E. (1999) *J. Biol. Chem.* 274, 8966-8972). Upon insertion into the membrane, the 17 amino acid signal peptide is processed, leaving an additional leucine at the N-terminus of A β . SPC99-Lon was cloned into the

- 196 -

pcDNA4/TO vector (Invitrogen) and transfected into 293 cells stably transfected with pcDNA6/TR, which is provided in the T-REx system (Invitrogen). The transfected cells were selected in Dulbecco's modified Eagle's media (DMEM) supplemented with 10% fetal bovine serum, 100 units/mL penicillin, 100 g/mL streptomycin, 250 g/mL zeocin, and 5 g/mL blasticidin (Invitrogen). Colonies were screened for A δ production by inducing C99 expression with 0.1 g/mL tetracycline for 16-20 h and analyzing conditioned media with a sandwich immunoassay (see below). One of the clones, designated as pTRE.15, was used in these studies.

Membrane Preparation

C99 expression in cells was induced with 0.1 g/mL tetracycline for 20 h. The cells were pretreated with 1 M phorbol 12-myristate 13-acetate (PMA) and 1 M brefeldin A (BFA) for 5-6 h at 37 C before harvesting. The cells were washed 3 times with cold phosphate-buffered saline (PBS) and harvested in buffer A containing 20 mM Hepes (pH 7.5), 250 mM sucrose, 50 mM KCl, 2 mM EDTA, 2 mM EGTA, and Complete protease inhibitor tablets (Roche Molecular Biochemicals). The cell pellets were flash-frozen in liquid nitrogen and stored at -70 C before use.

To make membranes, the cells were resuspended in buffer A and lysed in a nitrogen bomb at 600 psi. The cell lysate was centrifuged at 1500g for 10 min to remove nuclei and large cell debris. The supernatant was centrifuged at 100000g for 1 h. The membrane pellet was resuspended in buffer A plus 0.5 M NaCl, and the membranes were collected by centrifugation at 200000g for 1 h. The salt-washed membrane pellet was washed again in buffer A and centrifuged at 100000g for 1 h. The final membrane pellet was resuspended in a small volume of buffer A using a Teflon-glass homogenizer. The protein concentration was determined, and membrane aliquots were flash-frozen in liquid nitrogen and stored at -70 C.

γ -Secretase Reaction and A β Analysis

To measure γ -secretase activity, membranes were incubated at 37 C for 1 h in 50 L of buffer containing 20 mM Hepes (pH 7.0) and 2 mM EDTA. At the end of the incubation, A β 40 and A β 42 were measured using an electrochemiluminescence (ECL)-based immunoassay. A β 40 was identified with antibody pairs TAG-G2-10 and biotin-W02, while A β 42 was identified with TAG-G2-11 and biotin-4G8. The ECL

- 197 -

signal was measured using an ECL-M8 instrument (IGEN International, Inc.) according to the manufacturer's instructions. The data presented were the means of the duplicate or triplicate measurements in each experiment. The characteristics of γ -secretase activity described were confirmed using more than five independent membrane preparations.

Pharmaceutical compositions can comprise one or more of the compounds of formula I. For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules,

- 198 -

capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active compound. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), Remington's Pharmaceutical Sciences, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active compound, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 0.01 mg to about 1000 mg, preferably from about 0.01 mg to about 750 mg, more preferably from about 0.01 mg to about 500mg, and most preferably from about 0.01 mg to about 250 mg, according to the particular application.

The actual dosage employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the

- 199 -

proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

5 The amount and frequency of administration of the compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 0.04 mg/day to about 4000 mg/day, in one to four divided doses.

10 While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.
